Isolating microsatellites from Myrtaceae, useful for genotyping, particularly in breeding programs for tea tree, by reacting plant nucleic acid with immobilized oligonuclectides.

Claim 10; Page 36; 100pp; English.

A method has been developed of isolating a microsatellite (MS) from nucleic acid extract of a plant of Myrtaceae family. The method comprises: (i) treating the extract with one or more immobilised, single-stranded oligonucleotides (ON) having a consensus MS repeat sequence (MSRS) or its complement; (ii) washing under specified stringency conditions; (iii) eluting nucleic acid bound to ON; and (iv) sequencing the eluted nucleic acids to identify those containing an MSRS. Microsatellites (MS) isolated by the method, specifically from Melaleuca alternifolia (the tea tree, a source of a broad-spectrum germicidal oil, useful in pharmaceuticals and cosmetics), are useful as genotyping markers, particularly for breeding plants that produce the oil in higher

primers AAF79922-27 A encoding human and

were used to murine GL50 p

o amplify sequences polypeptides. GL50

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   yield or of better quality. Primers based on MS are useful for both inter - and intra-species genotyping. The selected washing conditions improve efficiency of recovery of microsatellites (MS) and reduce the number of washing stages required. Particularly about 86% of recovered sequence contain an MS repeat sequence, compared with 50-70% when the conventional washing procedure is followed. AAA35313 to AAA3557, and AAA3552 to AAA3557b represent nucleotide sequences from the present invention which contain microsatellite sequences. AAA35356 to AAA35561 represent oligonucleotide PCR primers used for identifying Myrtaceae microsatellite sequences. (Updated on 06-AUG-2003 to correct OS field.)

New glycoprotein receptor of treatment and diagnosis of

on surface of f cancer and fo

for drug

cells, useful for screening, also n

specific antibody.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC surface membrane of strongly proliferating cells, especially stomach carcinoma, having at least one determinant that corresponds with a CC determinant of CFR-1 protein and binding specifically to human antibody C103/51 and/or the murine antibody 58/47-69 (immunoglobulin M). The CC products of the invention have cytostatic, antibacterial and corresponds with a string family or activity and can be used in a vaccine or for receptor CC antiinflammatory activity and can be used in a vaccine or for receptor CC antagonism. The novel receptor is used for therapeutic in vivo generation CC of antibodies, for treatment and prevention of cancer (of oesophagus, CC stomach, gut, rectum, liver, gall bladder, pancreas, lung, bronchi, CC breast, cervix, prostate, heart, ovary and/or uterus), for treating a wide range of precancerous states (e.g. Helicobacter pylori-associated CC gastritis, tubular or villous adenoma, Barrett dysplasia/metaplasia of cesophagus, cervical intraepithelial neoplasia etc.), for diagnosis (as a cumour marker) and for identifying potential anticancer agents from their cability to bind selectively to amplify the human cysteine-rich rGF creceptor (CFR) described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Local

                              AAX60358-78 represents PCR primers and probes for lactic acid bacteria. They are useful for the identification of lactic acid bacteria and the detection of species specificity, especially comprising extraction of DNA in a sample and PCR using the above primers. The primers can be used for identification of lactic acid bacteria in fermented milk products without culture. The procedure can be also applied to analysis of intestinal bacterial flora for prevention and treatment of diseases of digestive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primer; probe; lactic acid bacteria; identification; species specificity; fermented milk product; intestinal bacterial flora analysis; digestive tract disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA3730 represent PCR primers and hybridisation probes used in the isolation of the PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New mammalian DNA sequences encoding transmembrane, PRO polypeptides, useful for screening of potential molecule inhibitors of the relevant receptor/ligand

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gao W, O

The invention relates to human PRO polypeptides and the polynucleotides encoding them. The sequences are useful in the preparation of a medicament for treating a condition responsive to a PRO polypeptide. The polypeptides are useful in a number of functional biological assays, as molecular weight markers for protein electrophoresis and as therapeutic agents. The polynucleotides are useful as hybridisation probes for a cDN
                                                                                                                                                                                                                                                                                                                                                          Gao W, G

11-FEB-2000;
18-FEB-2000;
The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 123 fully defined sequences as
                                                                   New secreted and transmembrane PRO polypeptides useful for treating cancers, kidney disorders, Crohn's disease, diabetes mellitus, hype-insulinemia, sports injuries and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; PCR; primer; secreted protein; transmembrane protein; PRO; tumous immune response; cardiac insufficiency disorder; calcium flux; umbilical vein endothelial cell; bone disorder; cartilage disorder; arthritis; wound healing; diabetes; skeletal muscle cells; obesity; Berger disease; nephropathy; Schonlein-Henoch purpura; coeliac disease; dermatitis; herpetiformis; Crohn's disease; thalassaemia; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cc given in the specification (including their extracellular domains either cc nucleotide (NA) sequences encoding PRO, a vector comprising the PRO NA, a comprising the vector, producing PRO, a chimaeric molecular cell comprising the vector, producing PRO, a chimaeric molecular comprising PRO fused to a heterologous amino acid sequence, and an antice comprising PRO fused to a heterologous amino acid sequence, and an antice comprising PRO fused to a heterologous amino acid sequence, and an antice converted the comprising PRO sector, producing PRO, a chimaeric molecular weight markers for protein comprising PRO antibody. Pro is useful as molecular weight markers for protein converted the converted properties and also for chromosome identification. PRO is also converted for a cDNA library to isolate the full-length PRO cDNA. PRO NA is consecular transgenic animals or knock-out animals which are useful for generating transgenic animals or knock-out animals which are useful in development and screening useful reagents. PRO NA is also useful for treating tumours. PRO1313 polypeptides are useful for treating cardiac insufficiency disorders. CC polypeptide is also useful for treating tumours. PRO1246 and pRO1246 polypeptide is also useful for treating tumours. PRO1246 and completed properties are useful for treating cardiam flux in human conjugations are useful for treating broad pro1474 collippetides are useful for treating broad pro1418 pro1130, pRO1250 and pRO1418 pro1130, pRO1250 and pRO1418, pRO1265, pRO1244 and pRO1382 polypeptides are useful for treating that assemilar or Crohn's collippetides are useful for treating that assemilar the useful for treating that assemilars. The present collipse properties are useful for treating that assemilars. The present collipse properties are useful for pro1418, pro1304, pro1314, pro1314, pro1314, pro1314, pro1314, pro1314,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see ARP45151 and ARF45153-1945161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperproliferation of the inside of blood

                                                                                                                                                                                                                                           Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-G150). The method is useful for mediated the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ineoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood

GLUT 10 is an insulin-responsive glucose transporter gene located in the type 2 diabetes linked region of chromosome 20012-13.3. The GLUT 10 polypeptide can be expressed by standard recombinant methodology. The GLUT 10 glucose transporter gene and protein are useful for studying and analysing biological processes of both glucose metabolism and type 2 diabetes. These are also useful in drug screening techniques, especially for screening modulators of glucose transporter activity or compounds having the ability to be transported across the cell membranes. Sequences ABL5829-315 represent primers specific for the various regions of the human GLUT 10 glucose transporter gene, used in single strand conformational polymorphism (SSCP) analysis of the gene
                                                                                                                                                                                            10-SEP-1999;

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              20-DEC-1996;

primers #20231 and #101381 (see AAV40626) are designed to amplify the mutated green fluorescent protein (GFP) gene from the E. coli plasmid pr64L-S65T-GFP. The GFP gene PCR product was used in the construction of novel temperature sensitive shuffling plasmid pMB430 (see AAV24562). This plasmid was used to demonstrate a novel method of in vivo recombination plasmid was used to demonstrate a novel method of in vivo recombination

DNA

sequences, in this case Savisyn

and Savinase

In vivo recombination of homologous DNA - using sequences different origins of replication that are effective under conditions, useful for scrambling enzyme genes to produce

s which include r different e variant

                                                                                                                                                    be used in a method of the invention, for inhibiting cell proliferation. They can also be used in methods for inducing sensitivity to radiation and DNA damaging chemotherapeutics in an individual and in a method for prolonging survival in an individual with cancer. The methods and antisense molecules are useful for inhibiting cell proliferation, especially cancerous cell proliferation, for inducing sensitivity to radiation and DNA damaging chemotherapeutics in individuals and for prolonging survival in an individual with cancer. Kits for carrying of the methods may be used to diagnose and/or treat cancer and for

The antisense oligonucleotide is used to study down-regulation of Rad51 protein in human brain, breast and prostate cells. Rad51 protein is defective in repair of damaged DNA, genetic recombination and the recombinational repair of DNA lesions, and plays a central role in cancer. Inhibiting cell proliferation involves administering to a cell a Rad51 antibody or its fragment. The Rad51 antibody or its fragment is useful for inhibiting cell proliferation, for treating disease states such as cancer, autolumune disease, arthritis, graft rejection, inflammatory bowel disease, proliferation induced after medical procedures such as surgery, angioplasty etc. in humans and animals
                                                                                                                             Antisense oligonucleotide R51AS9
                                                                                                                                                                                             14-NOV-2002

The method comprising contacting a tumour cell in vivo with a Rad51 inhibitor and a polymucleotide capable of expressing functional p53 protein. The method is useful for inhibiting or reducing tumour cell proliferation in an individual in vivo. The method is useful for treating hyperproliferative discreters, especially cancer (such as Hodgkin's disease, squamous cell carcinoma and leukaemia), premature aging, autoimmune disease, arthritis, graft rejection, inflammatory bowel disease, and proliferation induced after medical procedures such as surgery and angioplasty. The invention is useful in gene therapy. The present sequence is an antisense oligonucleotide used to illustrate the method of the invention

                                                                                                                                                                                                                                                                                        This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with at least one gene and/or their regulatory regions. Specifically, it refers to a method comprising contacting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated Cgd dinucleotides present in the target DNA. As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and PNA-oligomers that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPs) of the target sequence. This oligomicleotide sequence is a primer oligomer used for the analysis of CgG positions within genomic DNA, used in an exemplification of the

Novel antisense inhibitor of apoptosis nucleic acid useful for enhancing apoptosis in a cell, for treating cancer and other proliferative

Claim 8; Page 33; 135pp; English.

The invention relates to an inhibitor of apoptosis (IAP) antisense CC nucleic acid (I) that inhibits IAP biological activity, regardless of CC length of the antisense nucleic acid, the IAP proteins may be mouse or CC human XIAP, HIAP1 or HIAP2 Also included are a pharmaceutical cc composition comprising a mammalian IAP antisense molecule and a method of CC enhancing apoptosis in a cell, comprising administering a negative CC regulator of the IAP anti-apoptotic pathway to the cell. The IAP CC antisense inhibitor is useful for enhancing apoptosis in a cell in a cc cell and a method of CC mammal diagnosed with a proliferative disease. The method is useful for treating a patient diagnosed with a proliferative disease like cancer. CC The IAP antisense molecule is useful to treat, ameliorate, improve, CC sustain or prevent proliferative diseases (e.g. ovarian cancer. CC conditions where apoptosis is involved or implicated (e.g. embryonic CC development, viral pathogenesis, autoimmune disorders, neurodegenerative diseases, multiple sclerosis, lupus erythematosus and infection by herpes CC virus, pox virus and adenovirus). The present sequence is an IAP

Determining a toxicological response to an agent, useful for screening drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative O. 0

Claim 1; Page 338; 455pp; English

CC toxicological response to an agent, which comprises comparing the CC expression profile of one or more human toxic response genes to a creference gene expression profile indicative of toxicity, and so cC determining the presence of a toxic response to the agent. Also cC described: (1) an array comprising one or more polynucleotides selected cfrom the genes corresponding to the partial sequences given in ABZ82842 cC from the genes corresponding to the partial sequences given in ABZ82842 cC; and (2) determining if a gene putatively identified to be a toxic response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising: who capposing cells to an agent or isolating cells from a human subject who capposing cells to an agent; (b) obtaining the test gene expression profile of a putatively identified toxic response gene after exposure to a known toxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of the special responses on a cellular, organ or system level. The arrays comprising the human genes are useful for toxicological screening of drugs, pharmaceutical compounds and chemicals The present invention describes a method (M1) for determining

An allele specific primer (AAQ53925) was then used to amplify the template molecule, the first base incorporated into the extension products being radioactively labelled. Individuals homozygous for the TYR allele gave one extension product and those heterozygous for the allele gave two extension products. The extension products were captured on a grid by hybridisation with one synthetic oligonucleotide to which the 5' end of the allele specific primer was made complementary. See AAQ53926-47 for grid oligonucleotides. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                          28-NOV-1997;

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36734-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion

                            The invention relates to a human secretory protein, ZSIG-11. Host cells containing a vector comprising the ZSIG-11 nucleic acid are used for the recombinant expression of the protein. ZSIG-11 is a novel ligand polypeptide and specific antibodies can be used to detect its presence a biological sample. Probes derived from ZSIG-11 is expressed at high levels in testis, and could be used to identify/study prohormone convertases or endoproteases that exhibit testis specificity. Antagonists, including antibodies, are useful for inhibiting or eliminating the function of ZSIG-11. It is possible that ZSIG-11 and it antagonists will be useful as fertility inducing therapeutics. Sequence AAX34800-21 represent PCR primers for amplifying the ZSIG-11 DNA
                                                                                                                                                                                                                                                                                                                                                                                             29-SEP-1997;

This sequence represents a PCR primer used to amplify the mPMP70 gene that encodes a peroxisomal membrane half-transporter protein. The PCR product is used in a method for testing the effect of 4-Phenyl butyrate (4-PBA) treatment on cells derived from mice with X-linked adrenoleukodystrophy (X-ALD). The invention relates to a treatment for a patient with adrenoleukodystrophy. The treatment comprises administering an agent which causes peroxisome proliferation (e.g. 4-PBA). Peroxisome proliferation causes a reduction in the level of C24:0 or C26:0 fatty acids in the central nervous system of the patient. Adrenoleukodystrophy is associated with defective peroxisomal beta-oxidation of saturated long chain fatty acids. The methods are useful for treating a patient with adrenoleukodystrophy, and screening for candidate therapeutic agents for treating adrenoleukodystrophy PCR primer; adrenoleukodystrophy; 4-phenyl butyrate; 4-PBA; X-ALD; peroxisome proliferation; fatty acid reduction; treatment; mouse; peroxisomal membrane half-transporter protein; mPMP70; ss. The present sequence is that given in ABA91743, in the PC

the PCR

of a primer that was used, with the primer R amplification of the cleaved amplified

The invention relates to a method for transporting a polypeptide into the nucleus of a cell, comprising expressing a phytochrome comprising the polypeptide attached to the apoprotein component of the phytochrome in a cell, and exposing the cell to light where the phytochrome migrattes from the cytoplasm of the cell into the nucleus which transports the polypeptide into the nucleus. The invention also relates to regulating the transcription of a gene in response to light comprising expressing a phytochrome containing a heterologous transactivator or repressor attached to an apoprotein component of the phytochrome in a cell, and expossing the cell to light where the phytochrome migrates from the

The primer pair includes a Ddel restriction endonuclease site. An hy2-1 mutant of ecotype Landsberg erecta was outcrossed with wild-type ecotype Columbia, and a mapping population was selected from F2 families with a long hypocotyl phenotype. PCR primer pairs (see ABA91735-48) for 7 CAPS markers were used in a map-based cloning of the HY2 gene. The HY2 locus was initially mapped to an interval of about 66 kb between the markers cMZB10 and cF3124. Fine mapping localised the HY2 gene (see ABA91766) to 2 overlapping bacterial artificial chromosome clones, MZB10.18 and F3124. The HY2 gene encodes a ferredoxin-dependent biliverdin reductase, phytochromobilin synthase (see ABA95863), that is related to a family of proteins found in oxygenic photosynthetic bacteria. HY2 is an example of HY bilin reductases of the invention, which are useful e.g. for the conversion of biliverdin to phytobilin and the assembly of holophytochromes or phytofluors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Thale cress; PCR; primer; ss; nucleus; phytochrome; cytoplasm; heterologous transactivator; heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Arabidopsis thaliana.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        13-FEB-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABX50049;

CC
CC first active agent comprising an oligonuclectide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of cC junctions of genes encoding a polypeptide associated with lung and/or cc nasal airway dysfunction and a second active agent comprising an cc antiinflammatory steroid and ubiquinone. A composition of the invention cc has antiinflammatory, antiallergic, antiasthmatic, hypotensive, cc immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ន្តន្តន្តន្តន្ត្
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cytoplasm of the cell into the nucleus and the transactivator or repressor alters expression of a gene in the nucleus. The methods are used to transport a polypeptide into the nucleus of a cell or to regulate the transcription of a gene in response to light. This sequence represents a PCR primer used to amplify DNA used in the scope of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ABZ92516 standard;

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonuclectide antisense to the CC initiation codon, coding region, 5, or 3, end genomic flanking regions, 5 or 3, end genomic flanking regions, 6 or regions within 2-10 muclectides of 5 or casal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and biquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition is useful for treating or CC preventing a respiratory, lung or malignant disease or condition, also CC preventing a respiratory, lung or malignant disease or depleting levels of or reducing the prophylactic or therapeutic respiratory effect of an antisensory steroid in a subject, for reducing or depleting levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
The invention relates to a method of detecting and identifying strains microorganisms by providing a nuclease and a nucleic acid substrate containing sequences derived from microorganism(s), treating the nuclei acid substrate to form cleavage structure(s) and reacting the nuclease with the cleavage structures so that cleavage product(s) are produced. The method is used for the identification of strains of microorganisms. The microorganism comprises bacteria including Campylobacter,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20 BP; 3

                                                                                                                                                                                                           Escherichia, Mycobacterium, Salmonella, Shigella or Staphylococcus or virus comprising hepatitis C virus or simian immunodeficiency virus. The Mycobacterium comprises strains of multi-drug resistant Mycobacterium tuberculosis. The method is less sensitive to size so that entire gene rather than gene fragments, may be analysed. It facilitates the use of internal standards for subsequent analysis and data comparison, and increases the productivity of personnel and equipment. The present sequence represents a Cleavase BN substrate PCR primer.

Alzheimer's disease, amyotrophic lateral degeneration. of liver X receptor modulator in the treatment of e.g. stroke disease, peripheral neuropathy, Huntington's disease, lateral sclerosis and multiple sclerosis, neuron stroke,

7; SEQ IJ ö 6; 100pp; English.

The invention relates to a method for the treatment of neurodegenerative disorders involving the use of a liver X receptor (LXR) modulator. The invention also relates to a method for promoting cholesterol efflux from an astroglial cell using an LXR modulator. LXR-alpha (ADC81595) and LXR-beta (ADC81597) (collectively LXR) are nuclear receptor transcription factors that regulate the expression of a number of target genes encoding

CC including cholesterol. The LXR target genes include those encoding the
CC cholesterol metabolism-associated proteins ATP binding cassette
CC transcription factor SREHPIC, all of which are expressed in central
CC transcription factor SREHPIC, all of which are expressed in central
CC nervous system (CNS) tissue. LXR plays a role in the growth and repair of
CC neurons, as well as in cholesterol regulation, as administration of LXR
CC agonists enhances neurite outgrowth in hippocampal and cortical neurons,
CC limits the inflammatory response in microglial cells and upregulates the
CC expression of LXR target genes in glial cells. LXR agonist administration
CC also leads to increased cholesterol efflux from astrocytes and may thus
CC promote synaptic plasticity. Additionally LXR activators have been found
CC to induce neuronal differentiation in pheochromocytoma cells, and LXR
CC markh has been found to be upregulated following transient middle cerebral
CC treatment of neurological disorders such as stroke, Alzheimer's disease,
CC Parkinson's disease, fronto-temporal dementia, peripheral neuropathy,
CC dementia with few hodies. Huntington's disease amvortorshic lateral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAQ24701-Q24713 are a set of PCR primers which are C complementary to a sequence within a 2000bp inversion of chromosome 7 cr. This inversion (inv(7) (p14935)) is found in normal people but patients continered inversion from the disease ataxiatelangiectasia (AT) have a 70-100 fold concrease of the T-lymphocyte specific inversion inv(7). Using these concerns a screening test has been developed which can accurately comeasure lymphocyte-specific genomic instability and by extrapolation thus didentifies individuals at increased risk for the development of lymphoid contains a single property of the set of the development of lymphoid contains be used for identifying (specifically pre-natal) an individual chamazygous or heterozygous for AT and related syndromes (eg Nijmegan compounds or for identifying carcinogenic compounds. (Note: Revised entry submitted to correct the patent number format of US covernment-owned NTIS applications to prevent clashes with ongoing US correct web site at www.derwent.com/dwpi/updates/ntis_us.html.) PCR primers AAX60140-41 were used to amplify DNA encoding a Mycoplasma hyopneumoniae P102 protein clone. The P102 protein and its fragments are used in vaccines to protein adenst enzovtic pneumonia, particularly in swine. Recombinant P102 polypeptides may be used as antigens for diagnostic purposes to determine whether or not a biological test sample contains M. hyponeumoniae antigens or antibodies. The P102 polypeptides or DNA sequences may also be used for immunising or protecting non-human animals, preferably swine, against M. hyponeumoniae infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 21
                                                                                                                                                       Example
                                                                                                                                                                                        Recombinant antigenic Mycoplasma hyponeumoniae protein

pck primers AAP79931-36 were used to amplify cDNA encoding GL50 polypeptides. GL50 molecules are antigens on the surface of antigen persenting cells, which ostimulate T cell proliferation and bind to costimulate to a subject. GL50 modulating agents are used to modulate an immune response in a subject. GL50 polypeptides are a tumour cell. Diseases that can be treated using GL50 molecules are graft-versus-host disease, autoimmune disease, allergies, acquired immune deficiency syndrome (AIDS), and viral infections. The GL50 molecules can be used in vaccines. GL50 polymucleotides can be used in vaccines. GL50 polymucleotides can be used in vaccines disease, in tissue typing, and in forensic identification of a biological sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GL50; antigen; antigen presenting cell; T cell proliferation; tumour; graft-versus-host disease; autoimmune disease; allergy; viral infection; acquired immune deficiency syndrome; AIDS; vaccine; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid encoding a GLSO polypeptide for modulating a immune response and reducing the proliferation of a tumor cell.

The amplified DNA is used as a reference to identify mutations that cause sialidosis or similar disease and for chromosome mapping. The protein is used: (1) for treating lysosomal storage diseases (stalidosis, Tay-Sachs disease or Sandhof disease); (11) to screen for agents useful against viral stalidase (potentially useful as antiviral agents without side effects on the human enzyme); (iii) for disesting stalylated oligosaccharides or glycolipids in milk; and (1v) when inactivated, as antiviral agents (by binding to surface stalic acid with high affinity, so preventing binding of virus to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primers AAF79922-27 were used to amplify sequences from the 3' end of cDNA encoding human and murine GL50 polypeptides. GL50 molecules are antigens on the surface of antigen presenting cells, which costimulate T cell proliferation and bind to costimulatory receptor ligands on T cells. Outso modulating agents are used to modulate an immune response in a subject. GL50 polypeptides are used to modulate an immune response in a to reduce the proliferation of a tumour cell. Diseases that can be treated using GL50 molecules are graft-versus-host disease, autoimmune disease, allergies, acquired immune deficiency syndrome (AIDS), and viral infections. The GL50 molecules can be used in vaccines (GL50 polymucleotides can be used in vaccines (GL50 polymucleotides can be used to locate gene regions associated with genetic disease, in tissue typing, and in forensic identification of a biological sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid encoding a GL50 polypeptide for modulating a immune response and reducing the proliferation of a tumor cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; lactoferrin; transgenic bovine; ovum; bovine; ovary; zygote;

The sequences given in AAT77750-51 are primers which were used in the detection of expression of a human lactoferrin transgene in the saliva of mosaic animals produced by the method of the invention. The method of the invention comprises obtaining an ovum from bovine ovaries, maturing it in vitro, fertilising the mature ovum in vitro to form a zygote, introducing a transgene into the zygote in vitro where the transgene integrates into the genome of the zygote to form a transgenic embryo, maturing the embryo to preimplantation stage embryo in vitro, and transgenic the embryo in vitro, and transgenic to a preimplantation stage embryo in vitro, and transgenic transgenic contine. The method may also be used to generate transgenic transgenic bovine. The method may also be used to generate transgenic cover expected recombinant proteins in their milk from the transgenic cows containing the recombinant polypeptides may be used the transgenic cows containing the recombinant polypeptides from the transgenic milk. The production of transgenic bovine milk containing one transgenic milk. The production of transgenic bovine milk containing one transgenic milk. The production of transgenic bovine milk containing one or more recombinant polypeptides from the transgenic milk. The production of transgenic bovine milk containing one or more recombinant polypeptides is desirable since it provides a matrix wherein little or no purification is necessary for human consumption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          o.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transgenic bovine, mammary gland specific promoter, milk protein, human, mammary secretory cell, lactoferrin, serum protein lysozyme, cow, PCR primer, alphaS1-casein, ss.
                                                                                                                                                                                                                                                        Production of transgenic bovine embryo - by introducing trans:gene into fertilised ovum in vitro.

This sequence represents a primer for a human lactoferrin transgene. The amplified sequence can be used in the transgenic bovine of the invention. The bovine contains in its somatic and germ cells contain a transgene comprising: (a) a mammary gland specific promoter and enhancer; (b) a DNA sequence encoding a signal sequence functional in bovine mammary gland sequence exceptors cells; and (c) a DNA sequence comprising a heterologous polypeptide of interest. Where the transgenic bovine or a female descendant of it expresses the transgenic in mammary secretory cells so that the polypeptide is detectable in milk produced by the transgenic bovine or its descendant. The transgenic bovine is useful for the recombinant production of the human milk protein lactoferrin and the human serum protein lysozyme in its milk for use in pharmaceuticals and in finant formulae. The levels of transgenic protein secreted by the transgenic bovine in its milk are higher than that produced by transgenic sheep and mice. As the proteins are produced in the milk of the cow, they require little or no purification for human consumption
                                                                                                                                                                                                              Transgenic bovine useful for the production of heterologous proteins in its milk - contains a transgene linked to bovine secretory signal and is under the control of a mammary gland specific promoter and enhancer.

Discrimination of human V aggregation factor gene polymorphism.

WPI; 2000-057352/05.

The invention provides a method for the discrimination of the gene polymorphism of human Vth aggregation factor, where one of the following (1) to (6) residues/nuclectides in the aggregation gene is discriminated in the patient to be tested: (1) residue 495: guanine (G) or adenine (A) (2) residue 642: (G) or thymine (T), (3) residue 2663: (G) or (A), (4) residue 2763: (G) or (A), (5) residue 2863: (A) or (G), (6) residue 5112: (A) or (G). The method is useful in the genetic diagnosis of a diabetes patient. The method uses FPCR-SSCP (fluorescence-based polymerase chain reaction-single strand conformation polymorphism) for analyzing DNA samples for polymorphisms. Sequences AA239632-717 represent primers used for the FPCR-SSCP analysis of the human Vth aggregation factor gene Sequence 21 BP; 3 A; 1 C; 7 G; 10 T; 0 U; 0 Other; Disclosure; Page 10; 34pp; Japanese. ***************************

Transgenic cattle containing transgene controlled by mammary-specific regulator, for expressing proteins in the milk, particularly human lactoferrin for infant feeding formulations. Example 26; Col 57; 92pp; English. The invention provides a transgenic bovine in which the somatic and germ cells contain a transgene comprising a regulatory sequence from a gene expressed in mammary glands, DNA encoding a signal sequence and DNA encoding a naturally occurring heterologous polypeptide. The transgenic bovine, or its descendants, produce milk containing the heterologous

```
polypeptide. The transgenic bovines are used to express human milk and serum proteins or industrial enzymes, specifically for infant formulations that contain human latoferrin for control of intestinal tract infections and to improve iron absorption, particularly when botentiated by human lysozyme. The polypeptide expressed may also be human albumin, used as a plasma extender. The polypeptide expressed in milk of the transgenic bovine requires little if any purification before human consumption and is expressed at significantly higher levels than in transgenic mice or sheep. Large polypeptides that are difficult to express in other systems can also be expressed. Sequences AAZB7630-31 represent human lactoferrin gene specific primers
                                                                                                                                                                                                                                                                                                                                                                                              Sequence 21 BP; 3 A; 7 C; 2 G; 9 T; 0 U; 0 Other;

New isolated cDNA sequence encoding the mature human lactoferrin protein, useful for generating higher amounts of lactoferrin in bovine milk, which are beneficial and safe for human consumption.

Example 26; Col 58; 89pp; English.

lactoferrin (hLF) protein. Lactoferrin is the major iron binding protein in human milk, and may play a role in the absorption of iron by the small intestine. The invention concerns the expression of hLF in bovine milk. Included in the invention are methods for the production of transgenic bovine species, which produce milk with high lactoferrin levels. The hLF expression regulation sequence is placed under the control of bovine alphasi-casein expression regulation sequences. The transgenic milk may be either used as normal milk, or further treated to purify the recombinant polypeptide. This invention relates to a cDNA sequence encoding the mature human

Purified hLF obtained from the transgenic cows may be used in food formulations such as infant formula. The methods contained in the invention may be used to obtain milk from transgenic cows which has nutritional or other beneficial value. The advantage of the production of transgenic bovine milk using the isolated lactoferrin cDNA sequence, is that it provides a matrix where little or no purification is necessary prior to human consumption. The present sequence represents a PCR primer specific for human lactoferrin encoding DNA. The primer is used in the course of the invention ö Gaps ; 0 1.7%; Score 14.6; DB 1; Length 21; 81.0%; Pred. The present invention relates to a transgenic or chimeric bovine whose mammary gland cells contain a construct encoding a signal sequence, a polypeptide of interest and construct encoding a signal sequence, a polypeptide of the DNA sequence. The transgenic or chimeric bovine is useful for producing recombinant polypeptides in milk of female transgenic mammals. The recombinant polypeptide may be used in food formulations, particularly in infant formula having either nutritional or beneficial value. An infant formula containing human lactoferrin from the transgenic bovine milk provides bacteriostatic effect, which aids in controlling diarrhoea in newborn. Recombinant polypeptides may also be used to supplement common diet formulations

New transgenic bovine whose mammary gland cells contain DNA encoding a signal sequence, and a polypeptide of interest and an expression regulatory sequence, for producing polypeptides in bovine milk.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cotaxin. The binding member comprises an antibody variable heavy (VH) variable light (VL) domain from CAT-212 VH/VL domain and a VH/VL domain comprising one or more VH/VL complementary determining regions (CDRs). Ectaxin is a chemoattractant protein that binds to a specific receptor which is expressed predominantly on eosinophils. The binding member is useful for neutralising eccarain, which is useful in treating as thms. eczema and other atopic diseases such as rhinitis, food allergy, conjunctivitis, allergic colitis which are recognised as eosinophilon mediated diseases; for treating skin and other atopic conditions such as pooriasis, pemphigoid, wells' syndrome, cellulitis, drug eruptions; inflammatory bowel disease which includes eosinophilic colitis/enteritis/ gastroenteritis/Shulman's syndrome; vasculitis including Hugues-Stovin gastroenteritis/shulman's syndrome. The present sequence is a PCR primer used for converting encoding human antibody CAT-212 (ScFv-single chain cyariable region fragment) to IgG DNA (whole antibody) format

                                                                                                                                                                                                        This invention relates to a novel transgene for producing a recombinant polypeptide in a bovine species comprising at least one expression regulation sequence functional in at least one cell-type of the bovine species, in addition to a gene encoding the desired polypeptide. The transgenes and methods are useful for producing transgenit bovines which produce useful polypeptides (for example enzymes, immunoglobulins, clotting factors), especially in their milk. The present sequence is that of a PCR primer which was used for amplification of the human lactoferrin exemplification of the invention.
New transgenes for producing recombinant polypeptides in transgenic bovine species (especially in milk) comprise at least the protein coding sequence and an expression regulation sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                     AAT11420-T11473 are PCR amplification primers used for the amplification of exons 1 to 27 and the promoter of the human retinoblastoma RB1 gene, tased to amplify RB1 exons for use in a method of diagnosing mutations in the RB1 gene. By comparing the lengths of amplification products of RB exons from a suspected RB patient with those of RB wild-type DNA, patients can be diagnosed early which may avoid the need for radiotherapy. Any difference in length of exons between a suspected RB patient and those from wild-type RB1 indicates either a deletion or lineartion mutation. Further sequencing of suspect exons can pinpoint the mutation. The method is directed to the diagnosis of and targeted genetic screening for retinoblastoma in family members of a retinoblastoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAV42245;
```

```
Coligonucleotides AAV42230-49 represent response elements of the invention. The specification describes a response element which comprises two half site sequences of 8 bp which are configured as an everted repeat two half site sequences of 8 bp which he last 6 bp of the half site sequences share homology with the core hexamer motif classifying nuclear receptor target sites (NRRS). The response element binds to nuclear receptors. The response elements can be operatively linked to a promoter, and the construct used to transform host cells. The products can be used in a method for the detection of a modulator of transcription at Nur-RE. The multimeric composition can be used in a method for the detection of a modulator of transcription at Nur-RE. The multimeric composition can be used in a method for the involvement of a gene that is transcribed in a Nur-RE-dependent fashion. The composition can be used to inhibit HIV. It can also be used to treat various diseases, including T-cell receptor induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                o;

                                                                                                                                                                                                                               The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpp and/or recA genes from which probes condor primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be related microorganisms e.g. algae, archaea, bacteria, fungi and parasites, for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group, A nucleic acid (I) obtained cusing the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the detection of at least one antimicrobial agent resistance gene or at least one toxin of any bacterium and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against cused to design a therapeutic agent which is effective against corrected include Abiotrophia adiacens, Bordetella sp., which can be detected include Abiotrophia adiacens, Bordetella sp., corynebacteriaceae family, Pseudomonads group, Streptococcus sp., Neisseria gonorrhoeae and Staphylococcus sp. . Using DNA based tests provides faster crealists than substrate specificative tests as results can be determined in an hour and improved accuracy is also achieved. Apploble to the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                    Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chicken heparanase (hpa) cDNA amplifying 3' gene-specific primer ChkL2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heparanase, catalytic, cytostatic, antiviral, antibacterial, enzyme, anti-protozoan, neuroprotective, heparin, hpa, chicken, PCR primer; ss

The invention relates to an isolated avian and reptile nucleic acid, encoding a polypeptide with heparanase catalytic activity. The signal peptide of the nucleic acid can be used to express membrane-associated or secreted proteins in heterologous expression systems. The encoded polypeptides can be used to prevent tumour angiogenesis, metastasis and herasion, and to intervene with pathologies associated with impaired heparin-binding growth factors, cellular responses to heparin-binding growth factors, cellular responses to heparin-binding growth factors and cytokines, cell interaction with plasma lipoproteins, cellular tesponses to heparin-binding distintegration of neurodegenerative plaques. The present sequence represents a chicken heparanase (hpa) cDNA amplifying PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Staphylococcus aureus ribosomal polypeptide S20; antibacterial; bacterial ribosomal assembly; food poisoning; multisystem dysfunction; toxic shock syndrome; skin rash; inhibitor; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated Staphylococcus aureus S20 ribosomal polypeptide, useful for identifying inhibitors of bacterial ribosomal assembly.
                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to an isolated S. aureus ribosomal polypeptide S20, and the isolated polynucleotide molecules that encode them, vectors and thest cells comprising such polynucleotide molecules and also methods for the identification of agents that effect ribosomal assembly. The isolated polypeptide of the invention is useful for identifying inhibitors of bacterial ribosomal assemblies. The inhibitors identified by the method of the invention are useful as antibacterial compounds. The antibacterial compounds can be used against certain strains of S. aureus that can cause skin rashes, food poisoning, or multisystem dysfunction (toxic shock syndrome). Fragments of the polymucleotide of the invention are useful as antibacterial control of the polymucleotide of the invention are useful as a control of the polymucleotide of the invention are useful as probes or primers. This polynucleotide sequence represents a PCR primer of Staphylococcus aureus S20 ribosomal DNA of the invention 8

New RNA comprising double stranded RNA and a 3' or 5' overhang having a length of 0-nucleotide to 5-nucleotides on each strand, useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression of a target gene.

Claim 71; SEQ ID NO 175; 176pp; English.

The present invention describes an RNA (1) used for the interference or inhibition of expression of a target gene, where (1) comprises double stranded RNA of 15-40 nucleotides in length and a 3' or 5' overhang having a length of 0-nucleotide to 5-nucleotides on each strand, where the sequence of the double stranded RNA is substantially identical to a portion of a mRNA or transcript of the target gene. Also described: (1) interfering with or inhibiting the expression of a target gene in a cell by exposing the cell to an amount of (1); (2) a gene silencing array

different double-stranded RNAs; (3) an array-based method of assessing a different double-stranded RNAs; (3) an array-based method of assessing a benerotpic effect of a double-stranded RNA on a target gene; (4) validating a gene as a potential drug target for a disease or condition; (5) selecting an optimised sequence of a double-stranded RNA for and (6) a short double-stranded RNA for and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene comprising any of 311 20-78 inhibiting expression of a target gene comprising any of 311 20-78 ancientide sequences (see ADC16276 to ADC16586). (1) has cytostatic activity, and can be used in gene therapy. The RNAs are useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression of a target gene. They are useful for treating proliferative diseases, ö Gaps ö 1.7%; Score 14.6; DB 1; Length 22; 81.0%; Pred. Treatment of airway diseases such as asthma - by topically applying adenosine-free antisense oligo:nucleotide to airway epithelium of subject.

Example 5; Page 42; 71pp; English.

which involves the topical administration of an essentially adenosing free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for endothelial nitric oxide. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyperfor treating airway disease in a subject has been produced,

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5572-74. These multiple target oligonucleotides
coditions or mixtures. Thypical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, impaded respiration, respiratory
diseases, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, menacatic metastasses, as
well as all types of cancers which may metastasize or have metastasized
to the lungs, including breast and prostate cancer

                                                                                                                                                                         RESULT 211
```

```
The present invention describes a new composition comprising an antisense oligonuclectide (NON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergie, and/or antiaethmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of disease associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary hypertension, emphysema, chronic obstructive content of the courcinomas, and cancers which may metastasise to the lungs, including obrasta and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONS break down with the release of deoxyadenosine which activates adenosine receptors causing bronched sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
                                                                                                                                                                                                                                                                            antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; businfactant depletion; respiratory; bronchodilator; antinflammatory; immunosuppressive; antiathmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes,
sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33991) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human endothelial nitric oxide synthase polynucleotide fragment #1410.

```

```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cretinoblastoma, BRCAI, BRCAS, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNAA), APC, Factor V, Factor VIII, Factor IX, heemoglobin alpha locus 1 (HBA1), heemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, amoliopprotein E (APCS), LD receptor (LDKR), UDP-glucuronosyltransferase (UGTI) amyloid precursor protein (APC), presentlin-1 (PSENI) and presentlin-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, heemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, altheimer's disease, melanoma, adenomatous polyposis of the colon and contracting colonial proportion of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, gene therapy, adenosine deaminase deficiency, p51; beta-globin, retinoblastoma; BRCA1; BRCA2, CFTR, cystic fibrosis; cancer; Factor V, cyclin-dependent kinase inhibitor 2A; CDKN2A, melanoma; ABC, HBA1; HBA2, adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOB; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein B; LDLR; familial hypercholesterolaemia; MCT1; syndrome, APP; FSENI; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentlin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Adenosine deaminase deficiency correcting oligo SEQ ID NO: 40.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotide for targeted alterations of genetic sequences treating cystic fibrosis, comprises at least one mismatch and

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, crimical atoms, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CRM2A), APC, Factor V, Factor VIII, Pactor IX, haemoglobin alpha locus 2 (HBA2), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), anyloid precursor protein (APC), presentilin-1 (PSENI) and course protein (APC), presentilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, habeimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting cligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, gene therapy, adenosine deaminase deficiency, p53; beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A, CDKN2A, melanoma, APC; HBA1, HBA2, adenomatous polyposis of the colon; factor VII; Factor IX, thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1, APOE; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein B; LDLR; familial hyperchlesterolaemia; UGT1; syndrome; APP; PSEN1; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentilin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;

```

Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

Claim 7; Page 43; 294pp; English.

```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cretinoblascoma, BRCAI, BRCAI, CPTR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VIII, Factor IX, heemoglobin alpha locus (GDKNZA), heemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, amyloid precursor protein (APC), presentlin-1 (SBSNI) and presentlin-2 (PSENI). These can be used in the gene therapy of diseases (UGTI), amyloid precursor protein (APC), presentlin-1 (PSENI) and chamber's diseases, melanoma, adenomatous polyposis of the colon and Alzhahmer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOE; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein E; LDLR; familial hypercholesterolaemia; UGT1; syndrome; APP; FSENI; antisense; UDP-qlucuronosyltransferase; amyloid precursor protein; presentilin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Adenosine deaminase deficiency correcting oligo SEQ ID NO: 44.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         24-JAN-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 217
             ò
```

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor VIII, Factor IX, haemoglobin alpha locus (CDKN2A), haemoglobin alpha locus 2 (HBA2), WiHH, WSH2, MSH6, apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), anyloid precursor protein (APC), presentiln, 1 (PSENI) and presentiln-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, habieimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cretinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor VII, Factor IX, haemoglobin alpha locus (CDKN2A), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APOE), presentilin-1 (PSENI) and presentilin-2 (PSENI2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, altahemer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTB, cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOE; mismatch repair; MSH6; hyperlipidaemia; apolipoprotein B; LDLB; familial hypercholesterologia; UCT1; syndrome; APP; PSEN1; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentin-1; Albehame; disease; cytostatic; antisickling; antianaemic; haemostatic;
   Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .;
